

Burial Register Analysis

The Burial Register Excel spreadsheet allows us to analyse the burial register data.

The graph below shows the total number of burials each year in blue. The trendline indicates that generally the number of burials on the chapel site decreased over the 57 year period.

The second graph looks at the split between burials of adults and children. The trendlines show that while adult burial remained fairly constant over this time the number of burials of children decreased significantly as infant mortality was addressed.

Clear peaks can be seen in the graphs, some possibly indicating particular epidemics. Scarlett Fever which disproportionately affects children under 10 recurs on a roughly 5 year cycle.

All deaths were registered a coroner. Several served East Boldre with most deaths being registered with the Lymington coroner.
